# 1 General Information

Please read the »manual for micro annular gear pump« carefully before initial operation of the pump. The manuals for motor and control have to be seen as part of the pump manual. For missing manuals please call your distributor or HNP Mikrosysteme directly. Manuals are also available to download at www.hnp-mikrosysteme.de.

In case assistance is needed, please indicate the pump type visible on the housing.

#### 1.1 Use

The micro annular gear pumps described in this manual are suitable for continuous delivery and discrete dosage of water, watery solutions, solvents, methanol, oils, lubricating liquids, paints and varnishes as well as many other liquids.

If you intend to treat any aggressive, poisonous, or radioactive liquids, you must conform to safety measures as according to the regulations in force. Any project concerning handling of corrosive liquids should be previously discussed with the pump manufacturer.

The micro annular gear pumps *must not* be used for invasive medical applications, in which the liquid having had contact with the pump is reintroduced to the body.

Micro annular gear pumps exclusively are provided for use in the industrial area. A private use is excluded.

The micro annular gear pumps *must not* be used in aircrafts and spacecrafts or other vehicles without prior consent of the manufacturer.

Data concerning resistance of the pumps to the manipulated liquids have been elaborated according to the best of HNPM's knowledge. However, operating parameters varying from one application case to another, no warranty for this information can be given.

Information given in this manual does not release the customer from the personal obligation to check the integrity, correct choice and suitability of the pump for the intended use. The use of the micro annular gear pumps should be conform with technical norms and regulations in force.

If you wish to receive more information than comprised in this manual please contact directly HNP Mikrosysteme.

#### **1.2** Pump model designation

This manual is valid for the micro annular gear pump mzr-2509 Ex, mzr-2909 Ex, mzr-4609 Ex and mzr-7209 Ex manufactured by HNP Mikrosysteme GmbH, Bleicherufer 25, D-19053 Schwerin, Germany.

The bottom line of this manual shows issue and date of issue of the manual.

The micro annular gear pumps described in the operation manual are conform to the applicable EC standards and are permitted to bear the CE mark.

#### Table 1

Technical data micro annular gear pumps mzr-2509 Ex / mzr-2909 Ex / mzr-4609 Ex / mzr-7209 Ex

Warning

The material properties of a liquid (e.g. viscosity, lubricating property, particle content, corrosiveness) impacts the technical data and the lifetime of pumps. Under appropriate conditions the characteristic values may be increased or decreased.

#### Warning

If you intend to operate the pump out of the range of the above given specification, please consult the manufacturer. Modifications may be necessary to ensure successful operation. Otherwise the pump or the system may be damaged seriously.

Warning The manufacturer of the pump cannot guarantee the fatigue strength of the pump case due to the unknown load impact defined by different specification parameters like type of liquid, concentration, temperature. The cause for this restriction is a non predictable corrosion at the pump case like pitting, micro cracking and surface erosion which causes a wall thickness reduction and an increase of the notch effect. This could reduce the fatigue strength limit considerably. Under a particularly aggressive environment only a time dependent stability can be assumed. Because of the mentioned above the manufacturer cannot give specifications concerning the number of possible load alternations.

#### 1.8 Technical data of the Ex-motor

The micro annular gear pumps mzr-2509 Ex, mzr-2909 Ex, mzr-4609 Ex, mzr-7209 Ex are equipped with an explosion-proof DC-motor. The parameters of the motor are described in Table 2. The speed of the motor can be controlled with the optional motion controller S-HD-KL. One of the motor's features is a highly dynamic behavior. For operation it is recommended to use a power source of 24 V (with a power rating of 5 A).

The motor of the pumps is corresponding to the applicable EC standards. The confirmations according to EC 94/9/EG as well as of EC conformity are given.

### **1.9** Technical data of the brushless DC Ex-motor with controller (X2 version)

The micro annular gear pumps mzr-6359X2 Ex and mzr-7259X2 Ex are equipped with an alternative explosion-proof brushless DC-motor. The parameters of the motor are described in Table 2. The speed of the motor can be controlled with the internal motion controller. One of the motor's features is a highly dynamic behavior. For operation it is recommended to use a power source of 24 V (with a power rating of 5 A).

The motor of the pumps is corresponding to the applicable EC standards. The confirmations according to EC 94/9/EG as well as of EC conformity are given.

Measurements	
Diameter of motor casing	70 mm
Length of motor casing	285 mm
Weight	approx. 2,3 kg (without cable)

# 2 Safety instructions

Comply with the general safety instructions listed in the safety section as well as with the special safety instructions listed under the other main sections. All legal and corporate safety instructions have to be obeyed.

### 2.1 Labeling of instructions in the operation manual

The safety instructions listed in this operation manual are specially labeled. It can cause danger for persons, if they are not complied with.

Danger symbol		Non-compliance poses danger for persons.
High voltage symbol		Non-compliance poses danger of electrical shock.
Ex-symbol	< x3>	These instructions must be complied with in full for explosion-protection.

The type plate mounted on the pump must be complied with and has to be maintained in a clearly readable condition.

Please pay attention to items marked with the following symbols. Pump or system damage is possible if these warnings are ignored.

Warning

Information plates attached directly to the pump head **for example** name of the fluid inlet/outlet, sign with the direction of rotation must be observed and preserved.

### 2.2 Staff qualification and training

The staff for operation, maintenance, inspection and assembly must evidence appropriate qualifications for these works. Areas of responsibility, competencies and monitoring of the staff must be precisely regulated by the operating company. If the personnel do not have the necessary knowledge, they must be trained and instructed accordingly. If necessary this can be carried out by the manufacturer / supplier on behalf. In addition, the operating company must ensure that the content of this operating manual is fully understood by the personnel.

#### 2.3 Safety conscious work

The safety instructions listed in this operation manual, the applicable national regulations for accident avoidance and all internal working, operating and safety regulations of the operating company must be complied with.

#### 2.4 Safety instructions for the operator

The surface temperature of the actuators can exceed 60°C (140°F) in full load. You might want to provide protection to avoid accidental contact, which will cause burns on skin.

The drive should be protected against dust, water vapor condensation, humidity, splash water, aggressive gases and liquids. Please provide for adequate air ventilation and thus cooling of the motor.

Leakage (e.g. from the shaft seal) of dangerous conveyed goods (e.g. explosive, toxic, hot) must be lead away in such a manner that no danger is present for persons and the environment. Legal requirements must be complied with.

The existing protections against contact for the moving parts of the pump (such as for example the coupling) must not be removed during operation.

Take care that all risks resulting from the electric energy are excluded. (For details please refer to the instructions provided by the authorities in charge or your power supplier.)

Please insure, that the totality of the liquid supply accessories such as tubes, hoses, filters etc. are free from dust or dirt particles. Impurities such as metal, plastic or glass particles may impair or damage the pump leading to its failure.

Please, operate the pump with a filter featuring 10  $\mu$ m or smaller pores. It will protect the pump.

Warning

Warning

### 2.5 Safety instructions for maintenance, inspection and assembly

The operator must ensure that all maintenance, inspection and assembly is carried out by authorized and qualified personnel, who are sufficiently familiar with this operation manual.

In general, work on the machine should only be implemented when it is at a standstill. The instructions of the manual to shut down the pump must be definitely observed. Pumps or aggregates that convey liquids hazardous to health must be decontaminated. Immediately after operation is completed, all safety and protection equipment must be remounted and restarted.

Before restart of operation, the points listed in the initial start-up section (see section 7) must be observed.

Warning Do not disassemble the micro annular gear pump in case of malfunction. Contact the service personnel of your distributor or HNP Mikrosysteme immediately for help.

When sending a micro annular gear pump for repair or maintenance the »declaration of liquid contact« of the liquid pumped and the operation statement from section 16 has to be enclosed in the shipment.

#### 2.6 Unauthorized modification and original spare parts

Modification of the pump is only permitted prior to consultation with the manufacturer. Original spare parts and accessories authorized by the manufacturer ensure safety. The use of other parts may abolish the liability for any resulting damage.

#### 2.7 Improper mode of operation

The operation safety of the delivered machine is only ensured by its correct use as per section 1 in this operation manual. The limit settings given in the manual must not be exceeded in any case.

### 2.8 General safety instructions

Please also obey the following safety notes.

	Skilled personnel may only do <i>mounting</i> and <i>initial operation</i> of micro annular gear pumps.
<u> </u>	The pump can achieve <i>high pressures</i> . Use only the fluidic connections included in the delivery and be sure, that <i>fittings</i> and <i>tubes</i> are <i>permissible</i> and <i>specified</i> for these pressures.
	In order to decrease the pressure, provide the system with a <i>pressure control valve</i> directing the excess liquid to the storage tank or back to the suction side. In the case of blockage of the pressure side the operating pressure can multiply, this can lead to the damage of downstream components.
	If standstill occurs, the liquid in the pump may float in direction of the pressure drop in the pump. If necessary provide <i>back pressure valves</i> (see: accessories).
	Protect the micro annular gear pump and the electric actuator from <i>shock and impact.</i>
	In standard operation the <i>rotary shaft seals</i> used in the micro annular gear pump prevent leakage. Micro annular gear pumps are »technically sealed«, but <i>not hermetically sealed</i> , so that gases may escape from the pump or penetrate into the pump.
<u>A</u>	The <i>permitted electrical data setting</i> of the actuators may <i>not be exceeded</i> . Notice that especially <i>the accurate set of polarity</i> of the supply voltage is required, if not the control unit can be destroyed.
Warning	For the operation of a micro annular gear pump, the use of filters with a pore size of 10 $\mu$ m or smaller is required.
Warning	The preference state for the integration of the micro annular gear pump is horizontal. To prevent a possible penetration of liquid in the motor, the motor should be preferably assembled above the pump head.
Warning	It is necessary to check the liquid resistance in each individual case and to adapt the seal equipment.

## 3 Transport and storage

#### 3.1 Shipping pumps and protection measures

The pumps are shipped from the factory in such a manner that they are protected against corrosion and against shocks.

In addition, inlets and outlets are plugged with protective plugs. This measure is necessary to securely prevent foreign bodies from penetrating into the pump's interior.

#### 3.2 Transport damage

To avoid transport damage, the transport packaging must be protected against shocks.

HNP Mikrosysteme guarantees that the shipped goods are in perfect condition at the time of delivery. The pumps must be immediately checked for transport damage once the pumps have been received. If damage is noted, the shipper responsible and the pump manufacturer must be informed immediately.

#### 3.3 Interim storage

The following points must be obeyed for storing the pumps:

- Do not store the pumps in wet or damp rooms
- Protective plugs must be left screwed in
- Store temperature see according section 1.3 of this manual

#### 3.4 Conservation for storage after operation

When the micro annular gear pump operation is stopped for some time period the pump has to be cleaned by flushing. See also chapter 7.6 for decommissioning. When pump is clean it has to be filled with a preserving liquid such as precision mechanic oil or Isopropyl alcohol.

# 4 Description of the pump

#### 4.1 Principle of the micro annular gear pumps

Micro annular gear pumps are positive displacement pumps. They contain two rotors, bearing slightly eccentrically to each other; an externally toothed internal rotor and an annular, internally toothed external rotor (see figure 11). Due to their cycloid indenting, the rotors remain interlocked at any time, forming during rotation a system of several sealed pumping chambers. As the rotors revolve around their offset axis, the pumping chambers increase on the induction (suction) side and simultaneously decrease on the delivery side of the pump (see figure 12). A homogenous flow is generated between the kidney-like inlet and outlet.

figure 11

figure 12

Operating principle of the micro annular gear pump

Reciprocating and rotary pumps have a direct allocation to the fed amount of the displacement volume  $V_g$  of the pump and its actuator's number of revolutions n. The displacement volume describes the volume, which is theoretically fed with each revolution. The coherence of the flow rate referring to the formula (= volumetric flow rate) Q of the pump is:

$$Q = \eta_{Vol} \cdot V_q \cdot n$$

The volumetric efficiency  $\eta_{Vol}$  describes the coherence of the actual flow rate from the theoretical resulting value. Differences occur according to leaking, as the sealing on the inside of the pump is done over a gap. The volumetric

efficiency is dependent on the liquids and the pressure against which it has to be fed.

*Example*: The pump mzr-2909 Ex feeds with its displacement volume of 3 µl with 3000 RPM and a volumetric efficiency of 100 % referring to the abovementioned formula the flow rate of 9 ml/min. The following table shows the volumetric displacement in dependence to the number of revolutions for a volumetric efficiency of  $\eta_{Vol} = 100$  %.

	mzr-2509	Ex	mzr-2909	Ex	mzr-4609	Ex	mzr-7209	Ex
<b>speed</b> [rpm]	<b>Q</b> [ml/min]	<b>Q</b> [ml/h]	<b>Q</b> [ml/min]	<b>Q</b> [ml/h]	<b>Q</b> [ml/min]	<b>Q</b> [ml/h]	<b>Q</b> [ml/min]	<b>Q</b> [ml/h]
500	0,75	45	1,5	90	6	360	24	1440
1000	1,5	90	3	180	12	720	48	2880
2000	3	180	6	360	24	1440	96	5760
3000	4,5	270	9	540	36	2160	144	8640
4000	6	360	12	720	72	2880	192	11520

Table 9

The pressure, which the pump has to generate, is given by the construction of the fluidic system and the results of the hydrostatic pressure and the hydraulic resistance (given by tubes, contractions etc.).

The viscosity of the pumping liquid has an important influence on the volumetric efficiency. The volumetric efficiency increases with higher viscosity according to the smaller disengagement through the gaps of the pump.

Cavitation is an effect, which can reduce the volumetric efficiency from in a specific ceiling speed. With increasing viscosity (e.g.> 5.000 mPas), this ceiling speed is lower. This is the result of the liquids specified underflow of the steam pressure in the induction port of the pump, in which gases are building up in the pump.

The specific feature of the mzr-pumps is their highly precise design, as well as the guarantee of high accumulator pressure and high accuracy in flow rate and dosage. Therefore, space width and transverse space width of the rotors as well as the interspace to the adjacent case parts lie in the range of just a few micrometers. This precession is at the same time the criteria to achieve a volumetric efficiency in the range of approximately 100 %.

Theoretical flow rate of the micro annular gear pump mzr-2509 Ex, mzr-2909 Ex, mzr4609 Ex or mzr-7209 Ex

#### 4.2 Construction

The micro annular gear pumps mzr-2509 Ex, mzr-2909 Ex, mzr-4609 Ex and mzr-7209 Ex consist out pump head, coupling assembly and motor with cable gland. The micro annular gear pump has a bracket to the simple fastening.

figure 13 Design of the micro annular gear pumps mzr-2909 Ex and mzr-4609 Ex (mzr-7209 Ex similar illustration)

#### 4.3 Materials and liquids

Wetted parts	mzr-2909 Ex, mzr-4609 Ex	mzr-7209 Ex
Pump housing	stainless steel 316 L (1.4404, 1.4435)	stainless steel 316 L (1.4404, 1.4435)
Rotors, shaft, bearing	tungsten carbide Ni-based	tungsten carbide Ni-based
Shaft sealing	graphite-reinforced PTFE, 316L spring	graphite-reinforced PTFE, 316L spring
Static sealing	FKM, optional: EPDM, FFKM	FKM, optional: EPDM, FFKM

table 10

Construction materials of the wetted parts

The liquid resistance of the materials has to be checked and guaranteeing before the operation by the operator.

The liquid resistance has to be checked in every individual case. The feeding of non-lubricant liquids reduces the service life of the micro annular gear pump. This is also true for liquids containing particles.

### 4.4 Fluidic connectors

	Liquid inlet/outlet	Tubing
mzr-2909 Ex, mzr-4609 Ex	1/4"–28 UNF, front	OD 1/8" plastic tubes or stainless steel tubes (optional outer diameter 1/16")
mzr-7209 Ex	lateral 1/8" NPT internal thread front 1/8" NPT internal thread	tube/hose OD 6 mm

table 11

Liquid supply

The liquid inlet is marked with the letter »S«, the liquid outlet connection with the letter »D«. An arrow indicates the inherent turning direction of the shaft.

For protection against penetrating dust particles and contamination, sealing plugs are inserted into the threads. The sealing plugs have to be removed before the assembly of the fluidic connectors. Please reseal the threads with the cleaned sealing plugs when the fluidic connectors are disassembled.

The assembled fluid connectors have to be checked immediately after bringing the pump into operation. This is also true for service in a half-yearly cycle on tightness and leakage.

# 5 Modular system

The spectrum of applications of the high performance micro annular gear pump series may be expanded by using different additional modules. The modules allow for special applications, which could otherwise not be accomplished with a standard pump version. The modules may be combined with each other and with almost all available pump heads.

- Fluidic seal module prevents possible chemical reactions between the delivered liquid and the surrounding environment
- *Heat insulation module* extends the operating temperature range of the pump by protecting the motor from overheating
- *Heating module* enables to regulate the temperature of the fluid-containing parts of the pump
- Gas-tight sealed version: almost hermetically sealed pump, delivered as standard with the high performance mzr-pumps

The configuration of a given pump version should in each case be discussed with consideration to the specific requirements of the application. *Additional* customized modules may be designed on demand.

#### 5.1 Fluidic seal module

figure 14

Design of the micro annular gear pump mzr-4609 Ex with fluidic seal module

The module can be applied for liquids which tend to react or crystallize in contact with gases such as oxygen or water. The use of a fluidic seal module has to be confirmed with the pump manufacturer.

### Functioning of fluidic seal module

Based on the pump design in the rotary shaft seal there is a liquid boundary film where the liquid is in contact with the ambient. Here small amounts of ambient humidity or oxygen can penetrate into the pump getting over the sealing lip. To prevent penetrating molecules from outside into the pump but also hazardous substances coming out of the pump the fluidic seal module was designed.

For this reason a second rotary seal is added to the pump which is located in the fluidic seal module. Between the two rotary seals a fluidic chamber (see figure 15) is formed which is filled with a sealing liquid compatible to the pumped liquid. The fluidic seal module has two ports opposite to each other for filling and degassing. A pressure head can be applied to the sealing liquid to assure a support of the sealing function. In certain cases the sealing can be flushed.

The sealing liquid will dilute the pumping liquid during operation with a dilution ratio of approx. 1:1,000,000. The sealing liquid has to be compatible with the delivered liquid and has to be determined in interdependence. A cartridge can be used as a reservoir and is sufficient at maximum flow for one month in most cases.

Sectional view of the micro annular gear pump with fluidic seal module

#### Operation with fluidic seal module

The selected *sealing liquid* has to be *compatible* with the *delivered liquid*. The customer is in charge of the correct selection.

The filling procedure through the port has to be realized carefully. The ports have a 1/4"-28 UNF thread. They are displaced to realize a better degassing of the seal chamber also in a horizontal direction. The filling of the sealing liquid starts with the lower level port. The filling of the fluidic seal module continues until no bubbles can be seen on the outlet port side. When the liquid is free of

bubbles the outlet port has to be closed by vent screw. To fill the chamber a cartridge or syringe with an appropriate thread 1/4"-28 UNF can be used.

Sectional view of the fluidic seal module

Please note that the cartridge or syringe has to be filled up always with sufficient sealing liquid to avoid air or moisture contact.

In case of installation within explosion proof areas a level control for the reservoir of the seal liquid is necessary to avoid dry running of the pump.

If the fluidic seal module is empty the pump must shut down immediately.

If a different installation is selected than the standard installation (e.g. pump marking horizontal readable) it is possible to exchange the seal liquid inlet port and outlet port.

The cartridge always has to be assembled in a vertical way to guarantee that the liquid is gas free and can refill the sealing chamber.

### 5.2 Heat insulation modul

The heat insulation module enables to deliver hot liquids up to temperatures of 130° C (266 °C). It comprises thermally insulating coupling components made of plastic (PEEK) located between the pump and the drive. The drive should not be exposed to overheating. For this reason the heat transfer from the pump to the drive should be limited. An additional thermal barrier is provided by the plastic motor housing. If the surrounding temperature rises, the pump is working over a longer period or the manipulated liquid features a high temperature, convection cooling of the motor is recommended.

Earth the pump head additionally at the corresponding terminal clamp.

The pump carries the changed identification with the non insulating coupling components and the higher temperature:

### CE Ex II 2G Ex h IIC T3 Gb

Description of the single symbols:

- **CE Ex** Equipment meets the requirements of the 2014/34/EU
- **II** Equipment of the group of equipment II ("Non-mining industry")
- **2G** Equipment of the category 2, intended for the employment in zone 1 (explosion endangerment by inflammable gases, steams or nebulas), can be used also in zone 2
- **h** As explosion prevention measure the ignition enclosure was converted "constructional security" (c) according.
- **IIC** The equipment fulfills the requirements for the employment within highly combustible ranges, within which the explosion endangerment can be due to materials of the explosion group IIC (like e.g. hydrocarbons).
- **T3** The equipment fulfils the requirements to that temperature class T3.

#### 5.3 Fluidic heating- and cooling module

The fluidic heating and cooling module permits active heating or cooling of the pump head in the operating temperature range from -20 °C (-4 °F) to a maximum of 130 °C (266 °F). The module consists of a double casing covering the pump head and a thermoelectric couple type K, whose mode of integration varies depending on the pump size. Oil, water, superheated steam or adapted cooling liquids may be used as thermal liquids. If you are not sure, which heat transfer liquid is the best adapted in your case, HNP Mikrosysteme will help you find the suitable one. The thermal liquid ports 2 x G1/8" are displaced by 45°. The inlet for the heat transfer liquid is situated at the back (beveled) and the outlet is in the front (see figure 17).

figure 17

Micro annular gear pump with integrated fluidic heating- and cooling module (example of mzr-4609 EX)

The heating and cooling module is approved for use in EEx areas

Earth the pump head additionally at the corresponding terminal clamp.

Before connecting the liquid supply, please observe the following technical data! The maximal pressure of the heat transfer liquid should not exceed 20 bar.

Thermal element		IEC 584.3 identification
Туре	Thermocoax: 4ABAo15/35mm/Tl/D5 0/4ABAB40T/12m – ATEX EExia IIC T6	-+

## 5.3.1 Construction materials of heating- and cooling module

Wetted parts	mzr-2909 Ex, mzr-4609 Ex	mzr-7209 Ex
Pump case material	stainless steel 316L (1.4404)	stainless steel 316L (1.4404, 1.4435)

#### table 13

Construction materials of the wetted parts

The resistance of the construction materials to the delivered liquids should be verified by the operator for each individual application of the heating and cooling module.

The chemical resistance of seals in each individual must be verified by the operator.

### 5.4 Gas-tight seal module

Micro annular gear pumps are "technical tight", but not hermetical tight. That means there is a small possibility of gas or liquid coming out from inside of the pump or also penetrating into the pump between the inner plates of the structure. These plates have a super finish surface so that they are tight when layered over each other.

For the Ex-pump additional O-rings are mounted between the plates to increase the safety of thightness. With the gas-tight module and the fluidic seal module micro annular gear pumps are nearly hermetical tight.

The micro annular gear pumps mzr-2909 Ex, mzr-4609 Ex and mzr-7209 Ex will be delivered in a gas-tight version in every case.

# 6 Mounting / Installation

# 6.1 Check before installation

Inspect pumps for possible shipment damage.

Verify the following points to ensure the pump head is correct for your application (see section 3.2).

- Viscosity range of pumping liquid
- Displacement volume
- Flow rate

If there is a difference between the pump you need and the pump supplied, please contact your distributor or HNP Mikrosysteme directly. In this case do not start operation of the pump without checking with HNP Mikrosysteme.

(Ex

You must check not only the type of protection of the pump, but also the type of protection of all attached components. The nameplates of the individual components are important. The type of protection for the component with the lowest category always applies for the operation of all components in hazardous areas.

# 6.2 Details place of operation

Pay attention to the place of operation, that you need an installation location for service and enough room for maintenance. The pump should be installed and reinstalled without problems.

The place of operation mustn't be wet or damp. Don't install the pump in aggressive atmosphere!

# 6.3 Mounting of the micro annular gear pump

For the mounting of the micro annular gear pump there is a mounting angle to be fastened with four stainless steel M4 screws. The preferred mounting direction of the pump is horizontal. For vertical mounting the preferred direction is where the motor is above the pump head.

To prevent a possible penetration of the motor with escaping liquid, the drive should be preferably assembled vertically over the pump head.

When mounting the motor, insulating elements must not be inserted between the pump head and the motor. The connecting screws between pump and motor must be made out of electrically conductive material (e.g. stainless steel). Warning

Take care at the mounting of the micro annular gear pump that in the fault case leaking liquid cannot get into the motor or the control unit.

Take caution measures in the case of a leak so, that damage to adjacent

Ex>

Never install a pump in a small installation location without sufficient ventilation as the motor will be poorly cooled and can overheat.

facilities and the ambient environment are avoided.

The actuators must be protected against *moisture, dust and perspiration*.

# 6.4 Electrical Connections

The electrical connection of the motors must be implemented according to VDE directives by skilled personnel. The operation manual supplied with the motors must also be complied with.

 $\langle x3 \rangle$ 

Earth the motor using the terminal provided. Earth the pump head with heating module additionally at the corresponding terminal clamp.

# 6.5 Assembly instruction for tubing and accessories

Particles or soiling can block or impair the function of the micro annular gear pump.

Warning Please check that all wetted parts of the fluidic system are clean. Clean these parts in case before mounting the pump.

Please check whether there are swarfs in the screw connections, pollution remaining in reservoirs or soiling in valves, pipe work or filters.

# Assembly of the tubing and piping system

- 1. Please cut the tubing rectangular with a hose cutter.
- 2. If metal pipes are used an intensive cleaning procedure is necessary. After machining the pipes have to be cleaned and flushed very carefully. Smallest swarfs within the fluidic system can cause failure of the micro annular gear pump.
- 3. Connect the fittings with the tubing respectively the pipe work according to the attached installation instruction.
- 4. In the next step seal the pipe fittings at the suction side and discharge side of the pump head with PTFE tape. This is only valid for 1/8" NPT inside thread.
- 5. The thread of the fitting should be wrapped with 2-3 layers of PTFE tape and screwed in the NPT thread (see table 14). First manually, then tightened with ½ to ¾ wrench turns.

Clean the internal and external screw threads leaving no residues.

Cut the PTFE tape off and wind the end of the tape tightly around the screw thread.

Wrap the PTFE tape around the screw thread clockwise beginning with the second pitch of screw thread.

The PTFE tape should not stick out over screw thread because pieces can be cut off and get into the system.

table 14

Use of PTFE Tape

The PTFE tape should be wrapped

tightly around the screw thread

approx. 3 - 4 times.

Please note that the correct assembly of tubes respectively pipes with the pump head is a necessary condition to secure the right direction of flow. When you want to operate the pump in reverse direction please contact HNP Mikrosysteme since this is not possible in any application.

- 6. The suction line should be installed ascending to the pump for better degassing. The suction line should be designed as short as possible. The inner diameter of the suction line should be large to guarantee good priming of the liquid. At the planning of the pipe system take care of possibilities for degassing.
- 7. Operate the micro annular gear pump always with a filter with a pore size of 10  $\mu$ m or smaller. The filter prevents that particles or solids penetrate into the pump what can cause major damage.
- 8. Avoid dry running of the pump. Make sure that the liquid flow is not interrupted.

Warning Dry running of a micro annular gear pump can damage bearings and dynamic seals especially. A short term dry running at the start-up of the pump does not cause problems.

Warning The pump is equipped with a dynamic seal and a direct drive. Therefore the pump is not hermetic from a technical point of view. That's why it is periodically necessary to check the pump regarding leakage.

Please check that all pipes, fittings and screw fittings are tight.

If there is leakage on the suction side it is possible that air penetrates into the pump. In this case priming will be difficult. At the discharge side the liquid comes out of the pump. Dry running causes the pump to heat up.

If the pump will be operated within an explosion proof area a check valve right must be integrated in the pressure line behind the liquid outlet port of the pump. The check valve has to prevent that the pump empties during shutdown time.

Behind the discharge port the discharge pipe should be installed ascending..

In case the pump operates against a closed system a safety valve has to be installed in the discharge pipe to release pressure. In this case the return flow pipe must go back to the reservoir and not directly to the suction line.

### 6.6 Filter selection and use

In majority of cases it is recommended to integrate a filter on the suction side of the micro annular gear pump to ensure its secure operation. The recommended filter pores or mesh size should not exceed 10  $\mu$ m. The penetration of particles or swarf that could cause a blockage or damage to the pump can only be avoided by using an adapted filter.

HNP Mikrosysteme offers a choice of standard filters covering a broad spectrum of applications. You may count on our assistance for the selection of the most suitable one.

In order to select the best adapted filter, such operating parameters as flow rate, viscosity and degree of pollution of the liquid will be needed. An increase in at least one of the mentioned terms will require the use of a bigger filtering element or the pressurization of the delivered liquid. In case no suitable filter for high viscosity liquid can be found, it is possible to use a filter with slightly larger pore size. Prior discussion with HNP Mikrosysteme is here recommended. A filter with larger pores is still better than no filter at all. Alternatively an already filtered liquid may be used.

Warning Because filters have a large internal volume, it is recommended to fill in the filter and the suction tube with already filtered liquid in order to avoid a longer dry operation of the pump during the startup.

Warning Please control regularly the filtering elements for pollution. Cleanse regularly the filter or replace it with a new one. A polluted filter may considerably decrease the volumetric efficiency of a pump. Furthermore, because of the cavitation effects dosage imprecision and even pump damage may occur.

Warning A too small filter (too little filtering surface) may considerably decrease the volumetric efficiency of the micro annular gear pump. What is more, because of the cavitation effects dosage imprecision and even pump damage may occur.

# 6.7 Requirements for motor controller

To operate a micro annular gear pump mzr-2509 Ex, mzr-2909 Ex, mzr-4609 Ex or mzr-7209 Ex a motion controller is necessary.

Motion controller			
Power supply	UB	24	V
Max. continuous current	I <sub>dauer</sub>	1800	mA
Max. peak current	I <sub>max</sub>	2000	mA
Velocity range		14700	rpm
Operation modes		lxR, Encoder	
Encoder			
Max. voltage	Vcc	5 ± 10 %	VDC
Number of channels		2 (channel A, channel B)	
Counts per revolution and channel		500	counts/turn
Output signal at $V_{cc} = 5$ VDC		EIA Standard RS422	
		Driver: DS26LS31	
Output current		max. 20	mA
Phase shift $\Phi$ (nominal)		90°	

#### Table 15

Technical data motor controller

The mounting place of the motor controller has to be <u>outside</u> of the Ex-area.

Check for correct polarity. False connection may cause severe malfunction or will even destroy the electronic of encoder or motion controller.

For operation of the motor controller current overload has to be avoided, because the motor or the internal encoder will be damaged otherwise.

Optionally the micro annular gear pump mzr-2509 Ex, mzr-2909 Ex, mzr-4609 Ex and mzr-7209 Ex can be delivered with the controller S-HD-KL together with connection board.

To operate a micro annular gear pump only an authorised control module of HNP Mikrosysteme may be used.

# 6.8 Operation with motion controller S-HD-KL

The mounting place of the motor controller S-HD-KL has to be <u>outside</u> of the Ex-area.

The controller S-HD-KL controls the number of revolutions to achieve a constant flow rate or positions the motor for precise dosage volumes. Values can be set with the help of a potentiometer or with the external control signal 0-10 V. Second a serial interface allows the control of precise feeding and dosing tasks by an external PC. Included in the delivery volume are diskettes with a Windows<sup>®</sup> based software. The software enables the operator to manage dosing tasks by defining dosing data. A zero modem cable is included in the delivery volume to connect the pump controller S-HD-KL with a PC.

Controller S-HD-KL			
Type of control unit		4-Q servo amplifier	
Nominal voltage	U	24	V
Power supply	UB	12 - 30	V
Residual ripple		≤2 %	
Nominal voltage	U	24	V
Power supply	U <sub>B</sub>	12 - 30	V
Max. continuous output current	lcontinuous	1800*)	mA
Max. peak output current	I <sub>max</sub>	2000*)	mA
Speed range		104700*)	rpm
Input No. 1	input resistance	5	kΩ
Nominal analog speed	voltage range	± 10	V
Nominal digital speed	PWM signal	low 00.5 / high 430	V
	frequency range	1002000	Hz
Input/output No. 2	Error signaling	max. U <sub>B</sub> / 30 mA	
(progammable)	no error	switched to GND	
	programmed as input	low 00.5 / high 3,5 U <sub>B</sub>	V
Input No. 3, 4, 5	TTL - logic level	low 00.5 / high 3,530	V
	PLC - logic level	low 07 / high 12,530	V
Program memory		6,6	kBytes

\*) Values limited in the control unit with corresponding software

Table 16

Technical data controller S-HD-KL

Connection schema controller S-HD-KL

The connection board is helpful for bringing into service of the micro annular gear pump easily. It comprises the following interfaces:

- the possibility to connect the voltage supply to the delivered DIN socket
- the possibility to connect the voltage supply with screw clamps
- a 10-pole connector assembly for the motor cable
- speed set with potentiometer
- analog voltage signal 0-10 V for speed control at the screw clamps
- 9-pole connection plug for the RS-232 interface
- error output with status LED, programmable also as trigger input with screw connections
- tumbler switch S1 for the connection of digital input No. 3 of the motor control unit
- screw clamps for the connection of digital inputs No. 3, 4, 5 of the motor control unit

## Initial operation procedure

1. Connect the motor cable with the board S-HD-KL. Colour settings of wires see Table 17.

Pin controller S-HD-KL	Function
white	motor +
brown	motor -
yellow/green	screening / PE
red	V <sub>cc</sub> (5 VDC)
blue	SGND
pink	channel A neg.
grey	channel A
violet	channel B neg.
black	channel B
rot/blue	channel I neg. (index) (not in used)
pink/grey	channel I (index) (not in used)

Pin configuration motor cable adapter (10 Lead of cable) from motor to controller S-HD-KL (8 Lead of cable see 1.8)

Table 17

- 2. Connect the RS-232 connector of the MCDC2805 with a free serial interface of a PC. Apply the 9-pin *zero-modem cable*, included in the delivery volume.
- 3. Turn the potentiometer on the S-HD-KL to zero position by shifting clockwise to the right stop.
- Connect the voltage supply 24 VDC. This can be done with the integrated DIN connector or alternatively the 2-pole screw clamp (24 V = »+«; GND = »-«). Pay attention to the correct polarity.
- Check for *correct polarity*. False connecting may cause severe malfunction or even destroy the electronic of the control unit.

The mounting place of the motion controller is intended for use <u>outside</u> of the hazardous areas only.

### Explanation:

- It is possible to adjust speed of the micro annular gear pump with the potentiometer without the need to connect the serial interface.
- With the analog nominal value input (connection clamps »AnIN« and »GND«) it is possible to adjust speed of the pump with a standard signal 0-10°V. For this purpose it is necessary to plug the jumper on the S-HD-KL control unit from the »AnalogPoti« to the »AnalogExtern«. The serial interface does not need to be connected.
- In case of an overcurrent error the green status LED on the S-HD-KL control unit turns red
- The standard programs memorized in the motor control unit may be started with the tumbler switch S1.
- 5. Install the software »Motion Manager« described in the next chapter.

# 6.9 Connection of the micro annular gear pump with S-G05

In order to operate the pump a supplementary source of 24 VDC will be required. The ampacity of the voltage source should amount to around 4 A for the micro annular pumps mzr-2509X2 Ex, mzr-2909X2 Ex and mzr-4609X2 Ex. The ampacity of the voltage source should amount to around 4 A for the micro annular pump mzr-7209X2 Ex

The mounting place of the motion controller is intended for use <u>outside</u> of the hazardous areas only.

The micro annular gear pump with alternative brushless DC Ex-motor is connected via the Terminal Box S-G05. This enables an easy startup of the pump due to:

- the possibility to connect the voltage supply with the delivered plug connector J1
- alternative voltage supply via a DIN connector conform with DIN 45323
- separable pump connection "mzr-pump"
- speed set via potentiometer
- analog voltage input 0-10 V and 0 (4)-20 mA for speed control
- change of speed setting mode with a DIP-switch
- 9-pole connection plug for the RS-232 interface
- error output programmable also as trigger input or frequency output
- digital input with a screw connection
- possibility of installation on a 35 mm top hat rail

13	Ground analog input	grey / 0,14 mm <sup>2</sup>	Analog GND
14	Fault output	white / 0,14 mm <sup>2</sup>	Fault Out
15	RS-232 interface signal reception	yellow / 0,14 mm <sup>2</sup>	RxD
16	RS-232 interface signal transmission	green / 0,14 mm <sup>2</sup>	TxD

#### table 19

Connector J2 " mzr-pump" pin assignment configuration between the motor and terminal box S-G05

Installation of the cable wires

- tool: screwdriver blade 2.5 x 0.4 mm
- open the spring clamp with the screwdriver through the side slot
- cable in cable opening place (cable can be used with or without ferrule)
- remove the screwdriver

figure 21

Installation of cable wires in the connectors

LED Status	Definition
green	Power supply to the controller is active, no error
red	Motor error (current limitation or pump blocked)

table 20

LED for status indication

The operating speed of the micro annular gear pump may be set with:

- the potentiometer of the Terminal Box S-G05
- an external voltage signal 0-10 V
- an external, analog current signal 0 (4)-20 mA (without electrical isolation)
- an external potentiometer or
- the RS-232 interface

Individual start up procedures are described in the following points.

## 6.9.1 Startup with potentiometer

- 1. Connect the drive with the eight colored wires to the terminal box S-G05. The colors of the corresponding wire connections are described in the table 19.
- 2. Bring the potentiometer knob to null position by turning it clockwise to the limit stop.
- 3. Put the DIP-switch to the »Poti« position.
- 4. Connect the 24 VDC voltage supply to the terminal or to the DIN connector.

Make sure that the polarity of the supplied direct current is correct, otherwise electronics will be damaged.

- 5. Provide for a steady liquid supply to the pump in order to avoid dry operation.
- 6. The pump may now be put into operation by turning on the potentiometer knob.

### Remarks:

- You may adjust speed of the micro annular gear pump without the need to connect it to the serial interface.
- In case error occurs for example due to motor overload the green status LED on the Terminal Box S-G05 will turn red.

### 6.9.2 Startup with external 0-10 V signal

- 7. Connect the drive with the eight colored wires to the terminal box S-G05. The colors of the corresponding wire connections are described in the table 19.
- 8. Bring the potentiometer knob to the null position by turning it clockwise to the limit stop.
- 9. Put the DIP-switch to »0...10 V« position.
- 10. Connect an external 0-10 V voltage supply to the terminal clamps »AnalogIn« and »GND« to the S-G05. (see figure 22)

Startup with an external 0-10 V voltage signal

- 11. Provide for a steady liquid supply to the pump in order to avoid dry operation of the device.
- 12. Connect the 24 VDC voltage supply to the terminal or to the DIN connector.

Make sure that the polarity of the supplied direct current is correct, otherwise electronics will be damaged.

The input circuit at the analog input is layed out as a differential amplifier. If the analog input is "open" there is already a voltage of 2 V. That means in this case that the motor would be turning at a speed of about 2000 rpm. In order to set 0 rpm the input must be connected over a low ohm resistor to the analog ground (AGND) or connected to the AGND-voltage level.

13. The micro annular gear pump may now be put into operation by increasing the external voltage signal. A voltage signal of 0 V corresponds to 0 rpm and 10 V to the maximal programmed speed (see chapter 1.9).

### Remarks:

- You may adjust speed of the micro annular gear pump without the need to connect it to the serial interface.
- In case error occurs for example due to the motor overload the green status LED on the terminal Box S-G05 will turn red.

## 6.9.3 Startup with an external 0(4)-20 mA current signal

The conversion is done internally without electrical isolation. A potential separation is possible only with a external transformer module.

- 14. Connect the drive with the eight colored wires to the terminal box S-G05. The colors of the corresponding wire connections are described in the table 19.
- 15. Bring the potentiometer knob to the zero position by turning it clockwise to the limit stop.
- 16. Put the DIP-switch to »0(4)...20 mA« position.
- 17. Connect the external current source to the screw clamps »AnalogIn« and »GND« to the S-G05. (see figure 23).

Operation via an external 0 (4)-20 mA voltage

- 18. Provide for a sufficient liquid supply to the pump in order to avoid dry operation of the device.
- 19. Connect the 24 VDC voltage supply to the screw clamp terminal or to the DIN connector.

Make sure that the polarity of the supplied direct current is correct, otherwise electronics may be damaged.

20. The micro annular gear pump may now be put into operation by increasing the external current signal. 0 mA corresponds to 0 rpm and 20 mA to the maximal programmed speed (see chapter 1.9).

### Remarks:

- For operation with the signal 4...20 mA an offset of about 2.1 V should be set by entering the command MAV2170. In order to set the nominal values the micro annular gear pump must be put into operation via the RS-232 interface and start with the » Motion Manager « software. Save the command in the EEPROM with the command EEPSAV (see chapter 10).
- Speed of the micro annular gear pump may be set by sending an external voltage signal without the need to connect the pump to the serial interface.
- In case error occurs for example due to a motor overload the green status LED on the Terminal Box S-G05 will extinguish and a red one will light up.

# 6.9.4 Startup with external potentiometer

- 21. Connect the drive with the eight colored wires to the terminal box S-G05. The colors of the corresponding wire connections are described in the table 19.
- 22. Bring the internal potentiometer knob to the null position by turning it clockwise to the limit stop.
- 23. Put the DIP-switch to »0...10 V« position.
- 24. Connect an external 0-10 V voltage supply to the terminal clamps »AnalogIn«, »10 V« and »GND« to the S-G05.(see figure 22)

figure 24

Startup with an external potentiometer

- 25. Provide for a steady liquid supply to the pump in order to avoid dry operation of the device.
- 26. Connect the 24 VDC voltage supply to the terminal or to the DIN connector.
- Make sure that the polarity of the supplied direct current is correct, otherwise electronics will be damaged.

- The input circuit at the analog input is layed out as a differential amplifier. If the analog input is "open" there is already a voltage of 2 V. That means in this case that the motor would be turning at a speed of about 2000 rpm. In order to set 0 rpm the input must be connected over a low ohm resistor to the analog ground (AGND) or connected to the AGND-voltage level.
  - 27. The micro annular gear pump may now be put into operation by increasing the external voltage signal. A voltage signal of 0 V corresponds to 0 rpm and 10 V to the maximal programmed speed (see chapter 1.9).

### Remarks:

- You may adjust speed of the micro annular gear pump without the need to connect it to the serial interface.
- In case error occurs for example due to the motor overload the green status LED on the terminal Box S-G05 will turn red.

### 6.9.5 Startup with the RS-232 interface

- 28. Connect the drive with the eight colored wires to the S-G05. The colors of the corresponding wire connections are in the table 19.
- 29. In order to prevent uncontrolled startup of the pump, bring the potentiometer knob to the null position by turning it clockwise to the limit stop.
- 30. Put the DIP-switch to »Poti« position.
- 31. Connect the RS-232 interface of the Terminal Box S-G05 with a free serial interface of a PC. Use for that the delivered 9-pole null-modem cable.
- 32. Now install the delivered software as described in the chapter 10.
- 33. Connect the 24 VDC voltage supply to the terminal or to the DIN connector.
- 34. Provide for a steady liquid supply to the pump in order to avoid dry operation of the device.
- 35. The micro annular gear pump may now be put into operation with the available software (operating mode RS-232 see chapter 10).

### Remarks:

 In case error occurs for example due to the motor overload - the green error status LED on the Terminal Box S-G05 will turn red.

## 6.10 Installation of the software »Motion Manager«

The program »Motion Manager« provides easy operation and configuration of the motor together with an online graphic performance analysis tool. For installation a PC with Windows XP<sup>®</sup> or Windows 7<sup>®</sup> is required.

Install the software »Motion Manager« which is included in the delivery CD.

After successful installation start the program »Motion Manager« in the file »Faulhaber Motoren« via Windows<sup>®</sup> start menu.

If the diskettes of the »Motion Manager« are not delivered, because the software »mzr-pump controller« was included instead, you can download the software from the website <u>http://www.hnp-mikrosysteme.de</u>. The latest version can be downloaded in English or German under *Downloads*.

To program a micro annular gear pump motor and controller have to be put into operation. Both units have to be connected with the zero-modem cable.

# 7 Start up / Shut down

# 7.1 Prepare for start up

After the liquid supply system had been completed, please check once again the operating conditions of the micro annular gear pump as according to the following points:

- Are the inlet and outlet tubes correctly connected?
- Is the entire liquid supply system clean that means free of particles, foreign bodies, pollution or swarf?
- Has a filter been installed on the suction side?
- Has a sufficient amount of the right liquid been supplied?
- The pump does not run the risk of a dry operation?
- The entire liquid supply system has been checked for leakage?
- Is it possible to stop the pump by an emergency switch if an unexpected malfunction occurs at the startup?

# 7.2 First start of a mzr-pump

Switch on power supply. Now the micro annular gear pump can be taken into service by turning at the potentiometer or with help of the pump software (see section 10).

Start the filling in of the pump at low or middle speed (1000 - 3000 rpm).

Avoid dry operation of the pump. The pump should be filled in before it is put to operation.

If the pump is used in hazardous areas, it must not run dry. The pump and all pipes must be primed and filled with liquid before starting.

### 7.3 Re-start after dry run

After a short dry run (it is assumed that the pump is not yet damaged), you must ensure that the pump has cooled down to a temperature below its maximally allowed surface temperature. The pump and the pipes must be completely primed and filled.

Re-starting is prohibited after a longer dry run. The pump must be dismounted to check for damage and any damaged parts replaced. The pump may only be operated again after complete priming and filling and the restoration of the earth. Warning

# 7.4 Operation of the micro annular gear pumps in different temperature ranges

Micro annular gear pumps are highly precise manufactured devices. *No contamination* may reach the inside of the pump since this can damage the pump. Make sure therefore, that all of the wetted parts are kept absolutely free of dirt, dust or chips since this can affect the function of the pump.

*Flow monitoring* is also required for operation in hazardous areas to securely prevent dry running. If the flow stops, the pump must be stopped immediately.

During operation in hazardous areas, particular attention must be paid to the heat input in the liquid as well as to the increase of the pump's surface temperature. To avoid temperatures above a critical surface temperature one of the following two measures has to be implemented (see 7.5). If the specified top temperature is exceeded, the pump must stop immediately. For the monitoring the compliance with standard DIN EN 60079 has to be respected.

Remove dust deposits regularly from the pump's surface, drive and connection pipes so as to prevent the formation of ignition sources. The cleaning interval must be determined by the level of dust precipitation by the operator.

The fluid connections mounted to the pump have to be checked immediately after putting into service and following to this in a six month cycle on tightness and leakage.

Monitor the operating sound of the pump. If grinding noise occurs, switch off the pump immediately. Check the pump for wear optically. Friction between metallic parts can lead to overheating or formation of sparks.

If the pump is used in hazardous areas, a flow sensor must be installed directly downstream of the pump. The flow sensor must not create a noticeable back pressure in case of damage. If the delivery rate of the pump falls to 20% of the theoretical flow rate, the pump must be stopped immediately.

For operation of the micro annular gear pumps in surroundings with Ex-zone request of temperature range T1-3 and T4 no additional temperature measure is necessary for monitoring.

For operation of the micro annular gear pump in surroundings with Ex-zone request of *temperature range T5 and T6 additional temperature monitoring* is necessary.

## 7.5 Monitoring of operation in the temperature range T5, T6

### Monitoring of surface temperature

Temperature range	T5	T6
Max. surface temperature	60°C	45°C

Table 21 Max. surface temperature

### Monitoring liquid temperature on pressure side

Temperature range	Т5	Т6
Max. liquid temperature	80°C	70°C

Table 22 Maximum liquid temperature

# 7.6 Flushing procedure after use

After each service the micro annular gear pump should be carefully flushed with a non-corrosive, filtered and particle-free flushing liquid (see table 23 and table 24). During flushing procedure the pump should operate at a speed of about 3000 rpm and if possible against a low pressure (that can be obtained by using a restrictor, a capillary or similar). The flushing liquid must be compatible with the delivered liquid and suitable for solving the remaining liquid rests. Depending on the application for example water, or isopropanol may be used. If you have doubts whether a particular liquid is suitable for this function or not, please ask the manufacturer of the liquid or HNP Mikrosysteme.

Diagram of the flushing procedure

Liquids that remain in the pump may crystallize, coagulate or lead to corrosion and as a consequence impair the work of the micro annular gear pump.

Please make sure that the pump components and particularly O-rings and

sealing are resistant to the employed flushing liquid. (see table 24).

Warning

The flushing liquid (solvent) and the recommended duration of the flushing procedure depend on the delivered liquid (see table 24). The indicated flushing liquids are simple recommendations and should therefore be checked by the user as to their compatibility and suitability.

Regulations concerning use of substances dangerous to health should be followed!

	Nature of the delivered liquid	Flushing time [min]	Suitable flushing liquid
1	Oils, fats, plastifierss	15-20	isopropanol, ethanol, acetone, benzine/petroleum ether
2	Solvents (polar + nonpolar)	5-10	isopropanol, ethanol
3	Other organic liquids	10-15	isopropanol , ethanol
4	Refrigerating and cooling agents	15-20	isopropanol, ethanol
5	Neutral water/y solutions	20-25	isopropanol, ethanol
6	Basic solutions	25-30	DI-water (deionized water)
7	Organic acids	30-40	isopropanol, ethanol
8	Weak mineral acids	25-30	DI- water
9	Strong mineral acids	35-45	DI- water
10	Strong oxidizing liquids	35-45	DI- water
11	Paints, varnishes, adhesives	50-60	not specified - for further information please contact HNP Mikrosysteme.

#### table 23

Selection of the flushing liquid (solvent) and the duration of the flushing procedure depending on the delivered liquid.

Warning

Please make sure that the pump components and particularly O-rings and sealing are resistant to the employed flushing liquid (see table 24).

	Shaft sea	0-	O-ring material		
Flushing liquid	PTFE (Teflon <sup>®</sup> ), graphite- reinforced	UHMWPE	FPM (Viton <sup>®</sup> )	EPDM	FFPM
acetone	0	0	3	0	0
benzene	0	3	1	3	0
benzyl alcohol	0	-	0	2	0
butanol	0	-	1	0	0
dimethyl sulfoxide (DMSO)	0	0	3	0	0
ethanol	0	0	0	0	0
isopropanol	0	0	0	0	0
methanol	0	0	2	0	0
methylethylketone (MEK)	0	0	3	1	0
styrene	0	-	1	3	1
toluene	0	1	2	3	0
water	0	0	0	0	0
xylene	0	1	2	3	0
benzine/petroleum ether	0	0	0	3	0
oil / fine mechanics oil	0	0	0	3	0

Legend: 0 ... good suitability 1 ... suitability 2 ... conditional suitability 3 ... labile - ... not specified

table 24

Resistance of the sealing materials depending on the flushing liquid (solvent)

# 7.7 Shutdown of the micro annular gear pump

(£x

Ensure that no hazardous atmosphere is present.

In order to shut down a mzr-pump the following steps should be followed:

- Flush the pump with a filtered and particle-free flushing liquid (solvent) as described in the chapter 7.6.
- After the flushing procedure decrease speed of the pump to 0 rpm
- Fill the pump with a suitable conservation liquid (see chapter 7.7.1)
- Remove the pump from the system (see chapter 7.7.2)

By proceeding as shown in the diagram (see figure 27) you may prepare the pump for a longer standstill.

figure 26

Diagram of the shutdown procedure

# 7.7.1 Conservation

If the micro annular gear pump operates at irregular intervals or for other reasons should be put out of operation for a longer period, it should, after service and flushing procedure (see chapter 7.6), be filled in with a suitable conservation liquid.

The conservation liquid may be selected from the table 25 depending on the duration of the standstill and the resistance of the pump to the manipulated liquid. The indicated conservation liquids are simple recommendations and should therefore be checked by the user as to their compatibility and suitability. The figure 27 presents a diagram of conservation agent selection.

*Remark*: This diagram is repeated as a part of the figure 26 (shutdown procedure of the micro annular gear pump).

After the cleansing procedure the pump should be filled with a suitable conservation agent. You will find a choice of possible conservation agents in the table 25.

Diagram - selection of conservation liquid (CL)

Liquids	Solubility in water	Compatibility with the delivered liquid	Duration of storage	Breakaway torque	Toxicology	Viscosity	Description
isopropanol	+	+	0	0	0	+	solvent for organic compounds, cosmetics, essential oils waxes, and esters, antifreezers, antiseptic agents
acetone	+	+	0	0	0	+	solvent for a number of organic compounds, unlimited solubility in water, dissolves natural and synthetic resins, fats, oils and commonly used plastifiers
ethanol	+	+	0	0	0	+	solvent for organic compounds, fats, oils and resins
DI-water	+	+	-	-	+	+	solvent for many organic and mineral liquids
fine mechanics oil	-	-	+	+	+	+	cleansing and protective action (dissolves fats, tar, rubber or adhesive substances, protects against corrosion).
hydraulic oil	-	-	+	+	+	-	lubricating and preserving properties ( <i>Warning</i> : may resinate or deteriorate with time)
nitrogen	-	+	+	+	0	+	is not a solvent, may leave deposits after drying out
air / compressed air		+	+	+	+	+	is not a solvent, may leave deposits after drying out

Legend: + ... good/suitable o ... satisfactory; - ... bad/inadequate

table 25 Selection of the conservation agent

In order to prevent dust particles and foreign bodies from penetrating into the pump or the conservation agent from leaking out, please secure the liquid input and output openings with the delivered protective plugs or screws.

Warning

Water or DI-water should not be used as conservative liquids. They germinate already after a few days and build a biofilm which can later block the pump.

### 7.7.2 Dismantling of the system

- Put the drive out of operation by turning down speed to 0 rpm and by switching off the voltage supply. Make sure that the procedure described in the chapter 7.6 has been completed.
- Now that the pump has been stopped you may remove it from the system.
- Protect the inlet and outlet openings of the pump with adapted protective plugs or screws.

# 7.8 Trouble shooting

If the pump stops operating abruptly or has difficulties with starting operation, please undertake the following steps:

Try to liberate the micro annular gear pump:

- by turning the potentiometer knob back and forth or by connecting an analog voltage
- via the control software
- by pressing with a syringe a suitable flushing liquid (see table 23 and table 24) through the micro annular gear pump
- by changing the operating direction of the pump.

If these measures turn out to be ineffective, please contact the service staff of HNP Mikrosysteme (see chapter 15) and send the pump back to the manufacturer for inspection.

Warning

You should under no condition try to disassemble the pump by yourself. This may cause damage to the pump components and consequently annul your warranty claims.

# 7.9 Return of the micro annular gear pump to the manufacturer

For the return of a micro annular gear pump and components that have already been employed, please follow the instructions:

- drain any remaining rests of the delivered liquid from the pump
- flush the pump with an adapted solvent
- remove the filter elements from integrated or loosely delivered filters
- protect all openings against dust with the delivered protective plugs or screws
- return the pump in its original packing

The service personnel which carries out the repair should be informed about the condition of the already used micro annular gear pump. This is done by means of the "Declaration of media in contact with the micro annular gear pump and its components" (see chapter 16). This form may also be downloaded from the web site <u>https://www.hnp-</u> mikrosysteme.de/service/download-center.html.

The "Declaration of liquids in contact with the micro annular gear pump and its components" must imperatively be filled in. The nature of liquid which entered into contact with the micro annular gear pump and its components must be specified.

In case of non-compliance, the sender will be liable for any resulting injure to persons or any object damage.

# 8 Maintenance and service

## 8.1 Micro annular gear pumps

The first maintenance of the micro annular gear pumps has to take place after 4000 hours or after 6 month latest. If wear is low at the first inspection further maintenance intervals at the same operation conditions can be extended to 6000 hours or to a service interval of 12 month latest.

If there is increased wear at the first inspection the maintenance intervals have to be adapted according to the wear situation.

In case of maintenance and service please send the micro annular gear pump to your distributor or HNP Mikrosysteme directly. The address you may find on the front page of the manual or in section 15.

The micro annular gear pumps is sealed. It is prohibited to open or disassemble the pump. The warranty will expire immediately in such a case. HNP Mikrosysteme cannot give any warranty for replacing in case of damages to the pump which are related to faulty operation.

## 8.2 Metal bellow-type coupling

Maintenance of the standard metal bellow-type coupling is not necessary according to the enclosed manufacturer's data when assembled by HNP Mikrosysteme.

Within the maintenance intervals of the pump the screw tightenining torque must be checked after 6000 hours. If at the first inspection damage at the metal bellow-type coupling is found the maintenance intervals have to be adapted according to the operational data. This check must be part of the maintenance intervals of the micro annular gear pump.

### 8.3 Ex-Motor

The explosion proof motor itself is maintenance free. According to the manufacturer's instruction the explosion proof motor has to be checked 1-2 times per year regarding cracks and damages. This check must be part of the maintenance intervals of the micro annular gear pump.

# 9 Problems and their removal

D	isturbance	Cause	Solution
1	The pump does not work.	No power supply	Check the power supply.
2	The pump does not pump the liquid.	No liquid in the primary tank	Fill the recipient/tank with liquid.
		Presence of air or gas in the pump	The pump cannot run dry against the system pressure. Fill in the pump at no pressure or at reduced system pressure.
		Malfunction of the liquid supply components (such as in the delivery tube, the needle or external non-return valve)	Check the components for possible disturbances to be eliminated. Cleanse the accessories where needed.
		Failure of the electric installation	Check the electric installation for the correct cable configuration, loose contacts, etc.
		The pump did not receive the start signal or start conditions are not fulfilled.	Check if the start condition have been fulfilled start signals (software control, PLC, start signal) and the programs.
		Motor disturbance: the red error LED is on.	Check the failure condition of the motor control with the Motion Manager software.
3	The pump does not start to operate.	The pump does not take in the liquid.	The tubing on the induction side is too long or has a too small internal diameter (a too low NPSHA value).
			The tubing or the fluid connection on the induction (suction) side are not tight. Please check the intake connection and the tubing.
			Air bubbles in the fluid system (tubes, valves,)
			If the viscosity of the liquid is too high, apply pressure on the suction side.
			Check the pressure exerted on the primary liquid tank.
			An external non-return valve does not open. Check the non-return valves.
			Submit the non-return valve to a higher pressure, so that the pump may fill in.
4	The motor turns, but the pump does not operate.	No liquid in the pump	Fill the pump with liquid.
		Air bubbles in the liquid supply system (tubing, valves,)	Fill the pump and the liquid supply system with liquid.
		The non-return valve does not open.	Rinse the non-return valve.
		Blocked delivery tubing or needle	Cleansing, flushing or exchange of the delivery tubing or dosage needle
		The coupling between the motor and the pump is out of position.	Return the pump to the manufacturer.
		The pump shaft is broken.	Return the pump to the manufacturer.
5	The pump is filled with liquid, but does not pump it.	Error indicator (the red status LED on the terminal box is on and the motor control has set the error output).	Check the motor error status with the Motion Manager software (command GFS). Try to liberate the pump by making it operate for 1 s in a reverse direction with -1000 rpm.
			Adapt the motor current to the control. Contact the manufacturer of the pump.
		Presence of particles in the delivered liquid or blockage of the pump.	Check the motor error status with the Motion Manager software. Try to liberate the pump by making it operate for 1 s in a reverse direction with -1000 rpm.
			Return the pump to the manufacturer for cleansing. Use a filter, flush the liquid delivery

Disturbance	Cause	Solution	
		system.	
		Flush the pump with a syringe.	
	The non-return valve does not open.	Rinse the non-return valve.	
	Blockage of the delivery tubing or the needle.	Cleanse, flush or exchange the delivery tubing or the needle.	
	Air bubbles in the liquid delivery system, (tubing, valves)	Fill in the pump and the delivery system with liquid.	
6 Dosage volume does not correspond to the set values.	Air bubbles in the liquid delivery system, (tubing, valves ,) and the pump	Vent the liquid delivery system and check for untight fluid connections.	
	Pump shows cavitation.	Too long or too narrow intake tubing. Shorten the intake tubing or change the position of the pump.	
	Polluted or too small filter	Change the filter to a new or bigger one.	
	The non-return valve does not open.	Rinse the non-return valve.	
7 Speed of the pump cannot be adjusted.	Defective electric installation	Check the electric installation for correct cable configuration and loose contacts.	
	Defective drive control	Return the drive control to the manufacturer.	
8 Liquid drops from the dosing needle.	The non-return valve does not close.	Rinse the non-return valve.	
	Too high pressure on the primary liquid tank	Stop the delivery of compressed air on the primary liquid tank.	
	The liquid tank is placed at a higher level than the dosing needle.	Place the liquid tank at the same or slightly lower level than the pump.	
9 Liquid leaks from the fluidic seal.	The connection kit of the fluidic seal module is untight.	Check the assembly, tighten the threaded connections.	
	Pressure on the induction tank of the fluidic seal liquid	Stop the delivery of compressed air on the sealing liquid tank	
		Defective sealing - if necessary return the pum to the manufacturer.	
10 The dosage volume decreases with time.	Polluted filter.	Exchange the filter.	
	Deposits in the pump.	Flush the pump or return it to the manufacturer for dismantling and cleaning.	
	The pump is worn after a long operating period or after use with abrasive liquids.	New definition of the calibration factor of the pump, by modifying the pump characteristics graph necessary.	
11 Leakage from the pump	The sealing does not function correctly.	Return the pump to the manufacturer.	
12 Leakage from the coupling assembly	Defective shaft seal	Return the pump to the manufacturer to change the shaft sealing.	
13 Leakage from the fluid connections	Untight lock rings	Exchange or tighten the fluid connections, exchange the fluid connection fittings.	
14 Air bubbles on the delivery side	Loose fluid connections (particularly on the induction side)	Check and tighten the fluid connections.	
	The shaft seal is untight or worn.	Return the pump to the manufacturer.	
15 Minimal leakage during standstill	No error, cause relative to the operating principle	Employ a non-return valve. Place the liquid tank at the same or slightly lower level than the pump	
16 Excess temperature	The surface of the pump is hot.	Clean the surface of the pump, rinse the pump	
	The pump operates with difficulty.	The pump should be flushed.	
	Particles in the delivered liquid or deposits in the pump	The operation of the pump should immediatel be stopped! Return the pump to the manufacturer for cleansing.	
	Noise of beveling	The operation of the pump should immediatel be stopped! Return the pump to the manufacturer for cleansing and repair.	
	The motor surface or the motor interior are too hot.	High temperature indicator in the drive is on. The motor has been shut down by the thermistor. Return the pump to the	

Disturbance	Cause	Solution
		manufacturer.
17 The pump is noisy	Wearout of the pump or defective components	Do not continue to operate the pump, return it to the manufacturer for maintenance.
18 Lack of connection with the RS-232 interface	The pump is not connected.	Check the power supply 24 VDC.
		Check the connection of the interface and the null-modem cable. Change the cable if necessary.
	The drive control does not respond.	Interrupt the voltage supply for about 10 s, connect the voltage supply again. Automatic start of the integrated drive control
19 Overcurrent	Particles in the delivered liquid	Rinse the pump.
	The drive control does not respond.	Dosing needle is damaged. Needle should be cleansed, flushed or exchanged.
		Tubing on the delivery side, dosing needle or non-return valve are blocked. Cleanse, flush or exchange the components.
	Deposits inside the pump.	Flush the pump. If necessary return the pump to the manufacturer.
20 Undervoltage	Voltage supply < 12 VDC	Check the power supply 24 VDC.
21 Overvoltage	Voltage supply > 28 VDC	Check the power supply 24 VDC. The drive control may be damaged. Return the pump to the manufacturer.

Table 26

Trouble shooting guide

If unknown faults appear or an uncertainty arises from appearing faults in the working with the pump, immediately shut down the micro annular gear pump at first!

# 10 Software »Motion Manager«

For the programming of the micro annular gear pump the software » Motion Manager « must be installed (see section 6.8). The connection from controller to PC with the delivered zero modem cable has to be established and the micro annular gear pump have been taken into service.

# 10.1 Command mode

With software »Motion Manager« commands can be entered and sent directly to the motion controller to change the settings of the controller or execute movements.

Program »Motion Manager« for direct control commands for the micro annular gear pump

The entry of command lines takes place in the field »Enter command:«. When the command entry is completed this must be confirmed by pressing the button »Send« to send. The commands can alternatively be written in capital or small letters. Surplus blanks are ignored by the motion controller.

# **Example for feeding**

Command	Description
SOR0	Operation mode »RS-232«, <i>Source For Velocity</i> - set velocity with RS-232 command
V1000	Rotate with 1000 rpm (equivalent flow for mzr-2509 Ex = 1,5 ml/min, mzr-2909 Ex = 3 ml/min; mzr-4609 Ex = 12 ml/min; mzr-7209 Ex = 48 ml/min)
V0	Stop pump rotation (speed 0 rpm)
V3000	Rotate with 3000 rpm (equivalent flow for mzr-2509 Ex = 4,5 ml/min, mzr-2909 Ex = 9 ml/min; mzr-4609 Ex = 36 ml/min; mzr-7209 Ex = 144 ml/min)
SOR1	Operation mode <i>analogue</i> input«, <i>Source For Velocity</i> - set velocity with potentiometer setting on the connection panel

# **Example for dosage**

Command	Description
SORO	Operation mode »RS-232«, <i>Source For Velocity</i> - set velocity with RS-232 command
LR10000	Load relative position at 10000 to the pump 10000 = 5 revolution (equivalent quantity mzr-2509 Ex $\approx$ 7.5 µl mzr-2909 Ex $\approx$ 15 µl; mzr-4609 Ex $\approx$ 60 µl, mzr-7209 Ex $\approx$ 240 µl) (explanation: 2000 steps = 1 revolution)
Μ	Start positioning pump
LR20000	Load relative position at 20000 to the pump 20000 = 10 revolution, (equivalent quantity mzr-2509 Ex $\approx$ 15 µl mzr-2909 Ex $\approx$ 30 µl; mzr-4609 Ex $\approx$ 120 µl mzr-7209 Ex $\approx$ 480 µl)
Μ	Start positioning pump
SOR1	Operation mode <i>analogue</i> input«, <i>Source For Velocity</i> - set velocity with potentiometer setting on the connection panel

Regarding the four flank **analysis** of the encoder signal in the controller S-HD-KL the counter of the position must be set four times the amount of revolutions. To use the »Motion Manager« software please also refer to the online help function of the program.

### **10.2** Programming of motion controller

For dedicated applications (e.g. communication with process control, or dosage parameters according to sensor input) the motion controller S-HD-KL can be programmed with a simple program language. The program files consist of ASCII-commands. The filenames can be saved with the extension »mcl« (motion controller language). All motor settings can be set via the RS-232 port (e.g. maximum velocity, acceleration, relative position in position control mode, current parameter continuos and peak and the digital filter parameter for the dynamic performance). All settings and files can be stored to the onboard memory. Depending on the operation mode the motion controller therefore can run stand-alone.

The delivery volume comprises a disk with sample mcl-files which can be downloaded to the controller and stored permanently to the EEPROM.

### **10.3** Transfer of mcl-files to motor controller

mcl-files can be loaded over *File – Open* in the file-editor-screen.

Figure 31

Transfer of mcl-file as Transfer configuration files

When a window appears with the enquiry if the mcl files should be transferred to the »Motion-Controller«, answer by clicking on the »Yes« button.

In order to save the configuration and the programmed operation files in the EEPROM, please confirm the dialogue window with »OK« (see figure 32). With this confirmation the program will be saved in the memory with a resident status and will be available for future operation.

figure 32

Storage confirmation

For saving of settings of the configuration or program sequence in the onboard memory (EEPROM) answer the question »Should the EEPSAV command be carried out and the transferred settings saved?« with »Yes«. At that time the settings are written to the EEPROM. After switch on/off of the motion controller settings and program is available.

The delivery volume comprises the standard program *mzr-2509\_S.mcl, mzr-2909\_S.mcl, mzr-4609\_S.mcl, mzr-7209\_S.mcl* and the sample programs *switchdosage\_2509\_S.mcl, switchdosage\_2909\_S.mcl, switchdosage\_4609\_S.mcl* and *switchdosage\_7209\_S.mcl* for triggered dosage with an external switch.

The standard program *mzr-2509\_S.mcl* (see Listing 1) is saved at delivery state of the micro annular gear pump mzr-2509 Ex.

Upon delivery the motion controller is configured with following parameter:

- Operation mode analogue input, Source for velocity via potentiometer (Command SOR1)
- Enable driver (Command EN)
- Continuous mode (Command CONTMOD)
- Maximum velocity 4700 U/min (Command SP4700)
- Maximum peak current 800 mA (Command LPC800)
- Maximum continuous current 600 mA (Command LCC600)
- Acceleration 550 U/s<sup>2</sup> (Command AC550)
- Fault pin as error output (Command ERROUT)
- Asynchronous answer (Command ANSW1)
- Clear program memory with no programs

File mzr-2509 Ex.mcl

The standard program *mzr-2909\_S.mcl* (see Listing 1) is saved at delivery state of the micro annular gear pump mzr-2909 Ex.

Upon delivery the motion controller is configured with following parameter:

- Operation mode analogue input, Source for velocity via potentiometer (Command SOR1)
- Enable driver (Command EN)
- Continuous mode (Command CONTMOD)
- Maximum velocity 4700 U/min (Command SP4700)
- Maximum peak current 800 mA (Command LPC800)
- Maximum continuous current 600 mA (Command LCC600)
- Acceleration 550 U/s<sup>2</sup> (Command AC550)
- Fault pin as error output (Command ERROUT)

- Asynchronous answer (Command ANSW1)Clear program memory with no programs

File mzr-7209\_S.mcl

The file *switchdosage\_mzr-2509\_S.mcl* (see Listing 5) is an example for dosage with one micro annular gear pump mzr-2509 Ex.

Trigger start of the dosage with switch located between clamp »Fault« and »GND« of the connection board. A closing switch or a floating switch of a PLC can be used as trigger.

In the program the motion controller is programmed with following setting parameters:

- Load relative Position of the pump 10 revolution (Command LR20000) (20000 = 10 revolution => mzr-2509 Ex  $\approx$  15 µl)
- Start of dosage with switch (Command REFIN)

; File:	switchdosage_2509_e3_S.mcl
; Description:	Dosage triggered with switch for mzr-2509 Ex
;	Start dosage with switch on digital input 3
;	Fault as error output programmed
; Hardware:	Motion Controller S-HD-KL with switch, Controller MCDC3006S, Interface RS-232

File switchdosage\_mzr-2909 Ex.mcl

The file *switchdosage\_mzr-4609\_S.mcl* (see Listing 7) is an example for dosage with one micro annular gear pump mzr-4609 Ex.

Trigger start of the dosage with switch located between clamp »Fault« and »GND« of the connection board. A closing switch or a floating switch of a PLC can be used as trigger.

In the program the motion controller is programmed with following setting parameters:

- Load relative Position of the pump 10 revolution (Command LR20000) (20000 = 10 revolution mzr-4609 Ex ≈ 120  $\mu$ l)
- Start of the dosage over the switch (Command REFIN)

### 11 Accessories

The accessories available from HNP Mikrosysteme for micro fluidic systems comprise pipes, tubes, filters, fluidic connectors and pressure control valves, offering perfect match to your mzr-pump. Your distributor or HNP Mikrosysteme will be pleased to help choosing the right accessories.

### 12 Non-warranty

HNP Mikrosysteme is not responsible for any damage resulting from non-compliance of this manual for micro annular gear pumps.

The user is responsible for compliance of legal formalities pursuant to law in force, regulations under federal law, regulations in force, etc. This is true especially for feeding of aggressive, poisonous, corrosive etc. liquids and electromagnetic compatibility.

## 13 EU Directive

A Directive or EU Directive is a legal instrument of the European Community addressing at the member states and forcing them to implement specific regulations or targets. Leastwise, micro annular gear pumps are covered, by the scope of application of the following Directives: The following directives are of importance for the user of the described micro annular gear pumps:

### Low-Voltage Directive (2014/35/EU)

The Low-Voltage Directive is not relevant for micro annular gear pumps described in this manual, because the supply voltage is limited to a maximum of 30 VDC.

### Machinery Directive (2006/42/EU)

A micro annular gear pump is a machine and is consequently covered by this Directive. However, it may be a part of a machine or installation.

### EMC Directive (2014/30/EU)

The Directive on Electromagnetic Compatibility (EMC) applies to all electronic and electrical devices, installations and systems. Consequently, the Motion Controller of the micro annular gear pump is covered by the EMC Directive.

### RoHS Directive (2002/95/EU)

To our knowledge our products delivered to you do not contain substances or applications in concentrations that are forbidden by this directive. No substances contain our products delivered to you after our current knowledge in concentrations or application, the placing on the market in products according to the valid requirements forbade to the Directive.

### WEEE Directive (2002/96/EU)

Disposal of micro annular gear pumps has to be environmentally sound. All materials and liquids haveto be recycled in accordance with the relevant regulations. Electrical parts can not be disposed of as household waste. They have to be delivered to designated collection points.

### REACH regulation (EU) No. 1907/2006

HNP Mikrosysteme is not a manufacturer or importer of chemical substances subjected to registration, but in terms of regulation, a downstream user. As downstream user, we conduct the necessary communication with our suppliers to ensure future deliveries of all components necessary to us. We will notify you of all relevant, changes in our products, their availability and the quality of parts/products delivered by us within our business and coordinate the appropriate action in individual cases with you. Previous inspection did not show any limitation in the supply of material from our upstream suppliers.

### 13.1 Electromagnetic Compatibility (EMC)

Electromagnetic compatibility is defined as the ability of a electric or electronic device to function satisfactorily as intended in its electromagnetic environment without introducing intolerable electromagnetic disturbances in that environment.

### 1.1.1 EMC Directive and Standards

Comformity was proven by proof of compliance with the following harmonized standards by the company Dr. Fritz Faulhaber:

- EN 61000-6-4 (10/01): Generic standards Emission standard for industrial environments
- EN 61000-6-2 (10/01): Generic standards Immunity for industrial environments

These standards prescribe certain standardised tests for the emittedinterference and interference-immunity tests. The following tests are required due to the connections on the controller:

Generic Standard on Emitted Interference:	Description	
EN 55011 (05/98)+A1(08/99)+A2(09/02):	Radio disturbance characteristics	
Generic Standard on Interference Immunity		
EN 61000-4-2 (05/95)+A1(4/98)+A2(02/01):	Electrostatic discharge immunity test	
EN 61000-4-3 (04/02)+A1(10/02):	Radiated, radio-frequency, electromagnetic field immunity test	
EN 61000-4-4 (09/04):	Electrical fast transient/burst immunity test	
EN 61000-4-5 (03/95)+A1(02/01	Surge immunity test	
EN 61000-4-6 (07/96)+A1(02/01):	Immunity to conducted disturbances, induced by radio- frequency fields	
EN 61000-4-8 (09/93)+A1(02/01):	Power frequency magnetic field immunity test	

Table 2 Standards Summary

All tests were conducted successfully.

### 1.1.2 Information on use as intended

For micro annular gear pumps, note the following: Requirement for the intended operation is the operation according to the technical data and the manual.

### Restrictions

If the micro annular gear pumps are used at home, in business or in commerce or in small businesses, appropriate measures must be taken to ensure that emitted interferences are below the permitted limit a values!

#### Hinweis:

Im Sinne der Maschinenrichtlinie 2006/42/EG und des Leifadens für die Anwendung der Maschinenrichtlinie 2006/42/EG der Europäischen Kommission Unternehmen und Industrie, 2. Auflage Juni 2010, ist die Miniaturbalgkupplung als flexible Kupplung eine Komponente und damit keine Maschine und auch keine unvollständige Maschine. Als Komponente im Sinne der Maschinenrichtlinie ist die Miniaturbalgkupplung nicht mit einer CE Kennzeichnung zu versehen, erhält weder CE Konformitäts- noch Einbauerklärung und auch keine Seriennummer.

Declaration of compliance to applicable Directives	EEx ia IIC T652, IP6 LCIE 03 ATEX 6102 X Is designed and manu	X ufactured	in compliance with		g applicable Dire	ctives:
First applicable Directive	- ATEX Directive 2014/34/EU.					
Individual declaration of compliance	Compliance has been obtained by application of the following standards:					
Obtained through	EN 50014:1997 +A1 +A2 (General requirements) EN 50284:1999 (Group II, category 1G) EN 50020:2002 (Intrinsic safety) EN 50284-1:1998 (Dust)					
Harmonization made with	EN 60079-0:2012 + A11 :2013 (General requirements) EN 60079-11:2012 (Intrinsic safety) EN 60079-31:2014 (Dust) These standards have been compared to the standards used for certification purposes (according to the Clarification Sheet N° ExNB/10/397/CS) and no changes in the "state of the art" apply to the equipment.					
Proof of compliance	For which an EC-Type Certificate LCIE 03 ATEX 6102 X and a Notification LCIE 13 ATEX Q 4008 according to Annex IV of ATEX directive 2014/34/UE have been obtained.					
Under first Directive because included in the ATEX directive but not checked by the Notified Body	This product complies with electrical safety requirements as it is expressed in the Low Voltage Directive 2006/95/EC and has been manufactured in accordance to EN 61515 standard.					
Notified Bodies involved	The Notified Body responsible for monitoring the ATEX Directive is LCIE - B.P 8 - F92266 - Fontenay-aux-Roses. Its Identification number is 0081.					
Manufacturer's own warning	Subject to use for the purpose for which it was designed and/or installed in accordance					
Final declaration	We, the undersigned, listed Directives and s	with relevant standards and with the manufacturer's recommendations. We, the undersigned, hereby declare that the product specified above conforms to the listed Directives and standards.				
Signatory (shall be legally responsible)	Mr GUILLON		20 10

#### Patents

Micro annular gear pumps (and housings) are protected by assigned patents: EP 1115979 B1, US 6,520,757 B1, EP 852674 B1, US 6,179,596 B1, EP 1354135, US 7,698,818 B2. Patents pending DE 10 2011 001 041.6, PCT/IB2011/055108, EP 11 81 3388.3, US 13/884,088, CN 2011 8006 5051.7, HK 13 11 2934.9, DE 10 2011 051 486.4, PCT/EP2012/061514, EP 12 728264.8, US 9,404,492 B2, CN 2012 8003 8326.2. In the US, Europe and China additional patents are pending.

### 17 Safety information for the return of already employed micro annular gear pumps and components

#### 17.1 General information

The operator carries the responsibility for health and safety of his/her employees. The responsibility extends also to employees not belonging to the company that have a direct contact with the micro annular gear pump and its components during repair or maintenance works. The nature of media (liquids) coming into contact with the micro annular gear pump and its components must be specified in the corresponding declaration form.

#### 17.2 Declaration of liquids in contact with the micro annular gear pump

The staff performing the repair or maintenance works must be informed about the condition of the micro annular gear pump before starting any work on the device. The »Declaration of media in contact with the micro annular gear pump« should be filled in for this purpose.

The declaration should be sent directly to the supplier or to the company designated by the supplier. A second copy of the declaration must be attached to the shipment documents.

#### 17.3 Shipment

The following instructions should be observed for the shipment of the micro annular gear pump.

- drain any remaining liquid from the pump
- flush the pump with an adapted flushing liquid
- remove the filter elements from the integrated or loosely delivered filters
- all the openings should be air-tight plugged
- return the pump in the original packing
